

## Docker setup for M1 Macbook:

### 1. Download docker desktop here

- <https://docs.docker.com/desktop/mac/apple-silicon/>
- Click Mac with Apple chip and it should automatically start downloading

- While that downloads open a terminal and enter (this step is in the previous link so if you've done it already you don't have to do it again):
  - `softwareupdate --install-rosetta`
- Once docker is downloaded, double click the .dmg file in the downloads
- Drag the docker application into the Applications folder
- Open docker
- Follow the setup wizard

\*\*\* If you are going to use the Auto Run script you may not even need this step

### 2. Install git

- Type git in terminal and allow the installation of command line editor tools
